

IILM University, Greater Noida

Title- Python Programming

Name- Laxmi Siddharth Surbhi

Enrollment no - 25scs1003002242

Program & Semester- B.Tech in CSE & III

Organization Name - Codsoft

ABOUT PROJECTS

These projects helped to understand how Python can be used to create simple applications and solve everyday problems.

Projects I Worked On

- To-Do List
For managing daily tasks
- Password Generator
For creating random passwords
- Calculator
For performing mathematical calculations

TOOLS & TECHNOLOGIES

Language: **Python**

GUI: **Tkinter**

Editor: **VS Code**

Repository: **GitHub**

Concepts Used:-

- **Variables**
- **Lists**
- **Strings**
- **Operators**
- **Conditions**
- **Functions**
- **Modules**
- **User Input**

TO-DO LIST

A simple application where a user can keep track of their daily tasks.

What it can do?

- Add a new task
- Display tasks
- Complete a task
- Delete a task
- Manage multiple tasks

How??

used Python and Tkinter to create the application and used programming logic to manage the tasks.

What I learned?

learned how to work with lists, functions, buttons and user input.

CALCULATOR

A simple calculator that can perform different mathematical operations through buttons.

Operations

+ Addition

– Subtraction

× Multiplication

÷ Division

% Modulus

How ??

I used Python functions and Tkinter buttons to perform the calculations and display the results.

What I learned?

It helped to understand functions, operators, conditions and GUI events .

PASSWORD GENERATOR

A small tool that can generate a random password instead of making one manually.

What it can do?

- Set password length
- Generate random passwords
- Use letters and numbers
- Add special characters
- Generate a new password whenever required

How ??

used Python's random and string modules along with Tkinter for the interface.

What I learned?

I understood how modules, strings, random values and user input can be used together.

DEVELOPMENT PROCESS

- Understand the task
- Plan the features
- Write the Python code
- 4Create the interface
- Test the application
- Fix errors
- Upload the project to GitHub

CHALLENGES FACED

While making these projects, I faced some issues such as:

- Understanding how GUI buttons work
- Handling user input correctly
- Getting the calculator result to display properly
- Making the password generation work correctly
- Fixing errors while running the programs
- Organizing my projects on GitHub

How I Handled Them

I tested the code multiple times, found the errors and changed the code wherever required.

LEARNING FROM THE INTERNSHIP

Through these projects, I got practical experience in:

- Python programming
- Creating simple GUI applications
- Using functions and modules
- Handling user input
- Debugging errors
- Using GitHub
- Managing project files

CONCLUSION

The internship gave me an opportunity to practice Python by developing three different applications.

Working on these projects helped me improve my Python knowledge, logic building, problem-solving and confidence in programming.

Thank You!
